S 2205-1-U

1986 IDAHO AGRICULTURAL STATISTICS

STATE OF IDAHO
OFFICE OF THE GOVERNOR
Boise, Idaho

TO THE PEOPLE OF IDAHO:

Last year in this letter I discussed the poor market conditions for Idaho farmers and the resulting loan delinquencies, bankruptcies, and trouble in securing credit. The past year has not eased these problems and in most segments of our agricultural industry they have actually grown worse. Grasshoppers, drought and early frosts hampered the production of many farmers in 1985. I again requested the Idaho Crop and Livestock Reporting Service to conduct a survey of the farm finance situation in Idaho. The results of that survey have been analyzed and published by this office and the University of Idaho.

The condition of agriculture has deteriorated primarily because of continued declining land values and poor markets. The need to improve our markets and especially our exports has never been more critical. We have held round-table discussions during the year and have heard you say, among many things, we simply need to sell more of our product. We can feed a great number of people around a hungry world, but need the opportunity to do so. This publication is an important contribution to the data base needed to develop agricultural markets, particularly overseas. I hope that Idaho's farmers and ranchers survive in these troubled times. With hard work, fresh thinking and cooperation we can position Idaho agriculture to be even more competitive in the future.

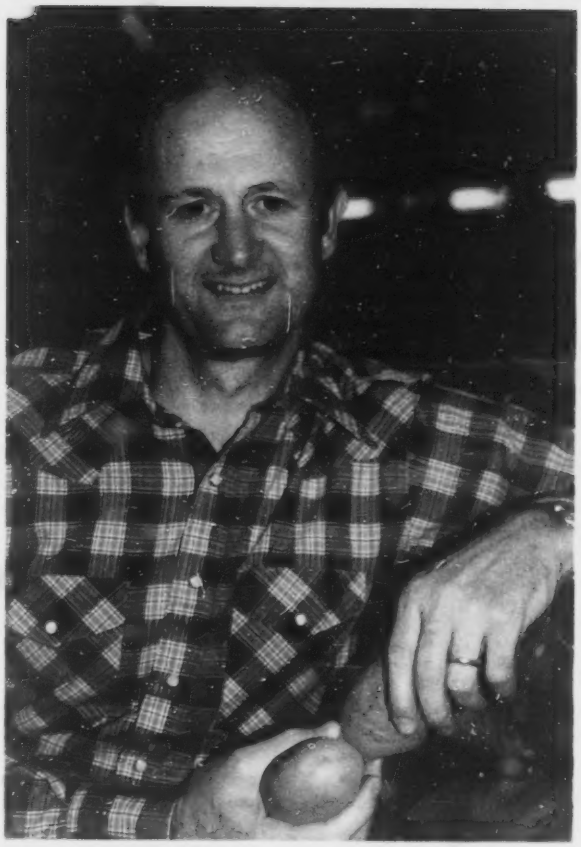
I am pleased that during the year our Department of Agriculture has worked out a new agreement with the Crop Reporting Service. We now even have a new name for the service — The Idaho Agricultural Statistics Service. I want to thank the Idaho Agricultural Statistics Service for their work on the farm finance survey and also for this publication. In addition, I want to thank all of you who supplied information to the Idaho Agricultural Statistics Service so that we can have the accurate and timely information presented in this bulletin. Finally, I would like to thank Dick Rush, our Director of Agriculture, for his effort in working out the agreement that brought the Crop Reporting Service much closer to Idaho Agriculture.

Sincerely,

John V. Evans
Governor of Idaho

GREAT SEAL OF THE STATE OF IDAHO
ESTO PERPETUA

OFFICE OF THE DIRECTOR OF AGRICULTURE
Boise, Idaho



TO FRIENDS OF AGRICULTURE:

It gives me great pleasure to bring you this, the 1986 edition of **Idaho Agricultural Statistics.** Last year in this letter I discussed the cooperative agreement between the Crop Reporting Service and this department. I am pleased to say this agreement has expanded and the service is now located in department space on Old Penitentiary Road in Boise. This closely ties a statistical unit to the Idaho Department of Agriculture and brings us a skill we have not had in the past. We have strengthened the cooperative arrangement, bringing us greater access to data, a critical element in developing a marketing analysis package.

The spotlight in this year's publication is on the potato industry of Idaho. This industry is world famous because of the excellent quality of the Idaho potato, supported by the fine marketing program paid for by Idaho farmers, processors, and shippers. The Idaho Department of Agriculture inspected more than 7.7 billion pounds of potatoes last year to make sure that only the best are shipped to our customers. Two years of frost at harvest time has not made this job easy, but it has made it more important, since continued fame and good sales depend on maintaining our high standards. Quality will be the number one factor in marketing our famous crop in 1986, and Idaho farmers, with help from our sandy soils and mild climate, are just the ones to produce the excellent potato that is Idaho's trademark.

Another important factor in marketing Idaho potatoes is transportation. Pounds of potatoes produced and stocks on hand are vital pieces of information needed to obtain trucks and rail cars at the least expensive rates. These statistics appear in this book, compiled from the data you, the farmers and ranchers of Idaho, supply to the Idaho Agricultural Statisics Service.

Just as potato farmers must deal with frost and increasing transportation costs, all of agriculture has had to face problems during the past few years. While there is no single easy answer and each person may have a different perspective, it is impossible to find solutions to marketing, production and cost problems without an accurate picture of where we've been, where we are, and where we may be going. Your efforts make this publication possible.

Sincerely,

Richard R Rush

RICHARD RUSH, Director
Idaho Department of Agriculture

Carla Killam, Editor

DEAR REPORTER:

This is the 15th in our series of Idaho Agriculture Statistics publications and over the years we have presented you with the many changes in Idaho's agriculture, both in the pictures and in the tables. Two changes this year are not as apparent as a new crop or new yield record. At the top of the page, the Statistical Reporting Service name has been changed to the National Agricultural Statistics Service and the Idaho Crop and Livestock Reporting Service has been changed to the Idaho Agricultural Statistics Service. These changes are important as they highlight an extension of the cooperative agreement with the Idaho Department of Agriculture. In addition to the new name, we have a new location. Since January 1 we have been located in a building beside the State Department of Agriculture building. This new location, along with our agreement, means that we are able to work much closer with the State Department of Agriculture and bring you additional data that, hopefully, will help to improve the marketing conditions for Idaho's products. The tables in the bulletin indicate, as usual, the ability of farmers and ranchers to produce, but as for the past few years, the price tables show a market that makes profit near impossible despite the high quality of the State's products.

As in the past, the major contributors to this publication have been Idaho's farmers and ranchers who report on all of the different questionnaires as well as the county agents and agricultural businesses that we contact for data. I want to thank all of you for your efforts as it is those efforts that make this bulletin possible. I also want to thank Bill Grange for donating many pictures and also for his help in picture selection. The other picture contributors acknowledged on the back page are also appreciated and thanked for their efforts. We hope you find the publication of benefit.

Sincerely,

Richard C Max

Richard C. Max
Statistician in Charge

AGRICULTURE IN IDAHO

The explorers Lewis and Clark visited what is now Idaho in 1805, and on March 3, 1863, Idaho was destined to become a State when President Lincoln signed the bill that created the Idaho territory. It was viewed as an area of diverse resources, and well it is as it is blessed with unmatched scenic beauty as well as fertile croplands, and endless ranges. The mountains and woodlands of the northern and central parts are in contrast to the semi-desert, irrigated South, with the rolling hills of the Palouse lying between. Although Idaho has large semi-arid reaches, it probably has more running water than any other state, and an abundance of minerals scattered within its boundaries. The deepest chasm on the North American continent, Hells Canyon, finds its way through the State's western border, providing recreation for the young and old alike. The untamed wilderness areas and fertile agricultural land have made Idaho a state of unforgettable scenery.

Agriculture is the number one industry and essential to the economy throughout the State. Idaho farmers have shown the ability to influence the nation's agriculture through the production of several crops. For 1985, Idaho's production ranks in the top 5 of the nation for 9 of the crops it grows. The Gem State led the country in the production of potatoes, growing nearly 24 percent of all potatoes produced in 1985. Hence, the auto license plates for the State proudly bear the inscription "Famous Potatoes." A number of adverse factors affected Idaho's agriculture in 1985. Like the rest of the Nation, agriculture had a difficult time as both livestock and crop producers were hurt with interest rates and low market prices. In addition, hot weather, grasshoppers and an early frost took a toll on crop production.

WEATHER AND GRASSHOPPERS HURT SMALL GRAINS

January

Temperatures well below normal while high pressure systems limited precipitation in most areas. Precipitation was as much as 1.0 inch below normal in some areas. Livestock were in good condition while feed supplies remained adequate in most areas. Farm activities were limited primarily to livestock care, farm maintenance, bookkeeping, and general chores. Early calving and lambing had begun by mid-month.

February

Unseasonably cold arctic weather continued and was accompanied by precipitation in many areas. While temperatures averaged well below normal, several storms moved across the State yielding varying amounts of snowfall. Early calving and lambing continued. Livestock were generally in good condition; however, newborns were adversely affected by harsh weather and frigid temperatures. Feed adequacy was mixed with some eastern areas reporting surpluses, while some northern farmers were forced to truck in hay from the Columbia Basin.

March

March remained cold with moderate amounts of precipitation. Temperatures were well below normal in the south and slightly above normal in northern areas. Snow cover began to dissipate gradually in some areas. Calving continued vigorously with near normal losses and early lambing drew to a close. Livestock conditions were good; however, calf pneumonia and scours were reported. Hay and feed supplies were adequate in most areas. Seed potato sales and cutting started while fruit tree pruning and spraying occurred in Southwestern orchards. Northern winter wheat appeared to be in good condition while across the State wheat was fair. By month's end, calving and lambing were 50 percent and 64 percent completed, respectively.

April

Snow-covered ground delayed spring fieldwork early in the month both in East and North Idaho. Higher temperatures were welcomed during the first half of the month. Only North Idaho received significant rainfall while warming in far southeastern areas was limited by remaining snow cover. By month's end, spring wheat was one-half seeded while spring barley seeding was nearly one-third finished. Potato and sugarbeet plantings were lagging behind the previous year and the average. More than one-half of the onion crop had been planted while fruit trees in most southwestern locations were in full bloom. Dry pea planting was less than half the average. Calving and lambing were nearing completion while hay and feed supplies remained in good condition. The winter wheat crop made it through the winter in fair to good condition.

May

By the end of the first week, nearly all of the onions were in the ground with 86 percent emerged. Corn, at 38 percent planted, was nearly twice the average. The second week of May brought cooler temperatures; however, crop progress continued. Only minimal potato emergence was reported. Corn plantings rose to 60 percent while onion emergence was nearly complete. Dry bean plantings were much slower than normal with only 3 percent in the ground by mid-month. May's final week included spotty showers and above normal temperatures. By month's end, nearly three-quarters of the potato crop was planted. Small grain seedings neared completion while their emergence rates came in at nearly 80 percent. Sugarbeet plantings continued slower than normal as thinning began in some areas. Dry pea and lentil plantings drew to a close. Alfalfa hay cutting began and the extent of the grasshopper infestation problem was beginning to be realized. Nearly 70 percent of both cattle and sheep had been moved to summer range.

June

Only 5 days were suitable for fieldwork during the first two weeks of June, while the latter two weeks had 7 days each. Several wet storm systems moved through the State during the first two weeks with above normal precipitation in all areas except the Southeast. Temperatures tended to be slightly below normal. By mid-month, field corn, oats, and potatoes had joined most other crops with completed plantings. Dry bean plantings were nearly complete. Nearly all small grains were emerged while approximately three-quarters of the dry bean and corn crops were out of the ground. More than half of the potato crop had signs of emergence. The first cutting of alfalfa hay was one-fifth harvested. Heading of winter wheat was just getting underway. The final two weeks of the month were characterized by sunny, dry weather conditions.

By month's end, nearly all crops were in the ground. Potato emergence and sugarbeet thinning were also complete. Most winter wheat was headed, while spring wheat and barley heading was just getting underway. Livestock and range conditions were good despite spotty dry areas. A few range fires were reported and the grasshopper infestation problem was moderate to severe in the south and east.

July

Nearly every day in the month of July was suitable for fieldwork across the State. Sunny, hot and dry weather dominated the State's weather picture throughout the month. Temperatures were well above normal except for areas that experienced rainfall. The first cutting of alfalfa hay was essentially complete by mid-month. The second cutting was underway. Cherry picking was essentially complete as apricot harvest continued. Grass seed and mint harvests were just getting underway. Three-fifths of the winter wheat and one-third of the spring wheat had turned color while one-quarter of the spring barley had turned. A few fields of early barley had been combined. By month's end, small grain harvest was well underway. Ten percent of the winter wheat had been combined compared to barley at six percent. Two-thirds of the spring wheat had turned color, but no harvesting was reported. Nearly one-third of the second cutting of alfalfa had been cut while almost one-quarter of the dry pea acreage had been harvested. One-half of the grass seed harvest was complete compared to one-fifth of the mint and two-fifths of the apricot crops. Potatoes, in some areas, were just beginning to turn color. There were reports of damaging army worm infestations of alfalfa and sugarbeets, as well as the effects of the grasshoppers. Livestock farmers sought to keep livestock in good condition despite dry range and pasture conditions.

August

The first week of August brought heavy rains mid-week across the State. Only 5 days were suitable for fieldwork during the first week and 6 days during the second. A cold front in the latter part of week 2, dropped temperatures into the 60's and 70's. The remainder of the month was characterized by isolated showers and temperatures well below normal. Seven days were suitable for fieldwork during the third week and 6 for the final week. By mid-month, the second cutting of alfalfa hay was cut. Dry peas were nearly three-quarters cut while lentils were almost two-thirds harvested. Grass seed was more than 80 percent combined. Apricot picking was nearly complete. Mint was less than 50 percent cut. Winter wheat was 36 percent harvested compared to spring wheat at only 8 percent. Barley was 18 percent harvested while oats were 28 percent cut. Potatoes were just beginning to turn color. By the end of August, winter wheat was more than two-thirds harvested, well ahead of both 1984 and the average. Nearly half of the spring wheat and more than half of the barley had been combined. Oats were 60 percent harvested. The second cutting of alfalfa stood at more than 80 percent cut. Nearly half of the potato crop was turning color or beyond with about 5 percent of the vines dying or killed. Both dry peas and lentil harvests reached nearly 90 percent complete while dry beans came in at 15 percent cut. Grass seed harvest was nearly finished while alfalfa seed harvest was just getting underway. Peaches were almost a third picked while onion harvest stood at 20 percent. Grasshopper infestation was down graded in many areas to light to moderate. Livestock remained in good condition despite short range and pasture.

September

The month started out good with slightly less than 6 days suitable for fieldwork. However, the second week allowed only 5 days and the next two weeks each had only 3 days suitable for fieldwork. Above normal temperatures and below normal precipitation during the first week were abruptly changed to below normal temperatures and above normal precipitation for most of the remainder of the month. Mid-September found winter wheat harvest essentially complete and spring wheat and oats at better than 90 percent combined. Potato harvest had begun with less than 10 percent of the crop dug. Alfalfa's second cutting harvest was nearly finished while the third cutting was almost one-third cut. Dry beans were more than a third harvested and onions more than half. Processing sweet corn was 81 percent picked as mint harvest drew to a close. Hops harvest was two-thirds complete. More than two-thirds of the peach crop had been picked while plum, nectarine, and pear harvests continued and apples began to turn color. Fall seeding of winter wheat was about normal at nearly 10 percent. As September drew to a close, potato harvest was a bit slower than normal at almost 20 percent. Hops harvest neared 90 percent. The third cutting of alfalfa hay reached 58 percent harvested. Dry beans were more than two-thirds cut while onions were slightly less than two-thirds dug. Sixty percent of corn for silage had been chopped and 6 percent of corn for grain shelled. Sugarbeets were 12 percent dug while apples were 18 percent picked. Nearly half the winter wheat crop seeded with 13 percent emerged. About one-fifth of the cattle and one-quarter of the sheep had been moved from summer pasture.

October

The first two weeks of October were dominated by both lower temperatures and precipitation. During the second week; however, North Idaho did receive significant rainfall. Six days were suitable for fieldwork during week 1 and 5 days in week 2. The third week brought nighttime temperatures near or below the freezing mark with daytime highs in the 60's and 70's. Six days were suitable for fieldwork during the third week while only 4 days were suitable during the last week. By mid-month, nearly two-thirds potato crop had been harvested. The third cutting of alfalfa hay was complete while dry bean harvest drew to a close. A slower than normal onion harvest was slightly more than 80 percent dug. Corn chopped for silage was finished while one-quarter of the corn for grain was harvested. Nearly one-third of the sugarbeets were out of the ground. Two-thirds of the apple crop was already picked. More than 80 percent of the 1985 winter wheat crop had been seeded with nearly one-half emerged. Nearly three-quarters of the sheep and less than two-thirds of the cattle moved from summer range and pasture. As October drew to a close, harvest of most crops tended to follow suit. Potatoes, apples and onions were all more than 90 percent harvested. Nearly half of the corn for grain was out of the field while 60 percent of the sugarbeet crop was dug. With all winter wheat seeded, almost three-quarters of the crop was already emerged. More than 90 percent of the sheep and 80 percent of the cattle were removed from summer range. Livestock were in good condition.

November

Six days were suitable for fieldwork during the first week. Temperatures were 5 to 10 degrees above normal in the southeast and near normal over the remainder of the State. By the end of the first week, potato digging was nearly complete with only isolated fields left to be harvested. Corn for grain was one-half shelled while sugarbeets were two-thirds dug. Winter wheat was more than 80 percent emerged. Cattle and sheep were virtually all moved to winter pasture. The second week of the month was characterized by below normal temperatures and heavy precipitation. Small grains began to go dormant and frost-damaged spuds were disposed of in many areas. Record low temperatures and snowfall swept across the State during the latter two weeks of the month. Temperatures were from 8 to 30 degrees below normal. Fall calving was underway in many areas while spot shortages of hay were reported. Record snowfall over Thanksgiving. Feeding situation came 2-4 weeks earlier than normal.

December

Temperatures continued well below normal during first two weeks. Snow and freezing rains fell in many valley areas. Early in the second week, a cold trough of low pressure swept through the State producing wet snow. This system was quickly followed by a northerly flow of cold, dry air dropping low temperatures into sub-teens and below zero. Stagnated air was trapped in many valleys bringing fog and smoke to many areas. The last half of December was characterized by below normal temperatures and nearly no precipitation. Only minimal farm maintenance activity was reported. Livestock care, feeding, and marketing was the dominant work underway. Early lambing began in some areas. Livestock condition remained good and hay supplies adequate.

SOURCE: Economic Indicators of the Farm Sector, State Income and Balance Sheet Statistics, USDA-ERS.

[1] Except for barley, corn, oats, dry edible beans, potatoes, apples, peaches, prunes and plums, the commodities include only estimates of income for which USDA estimates the value of production for 1984.

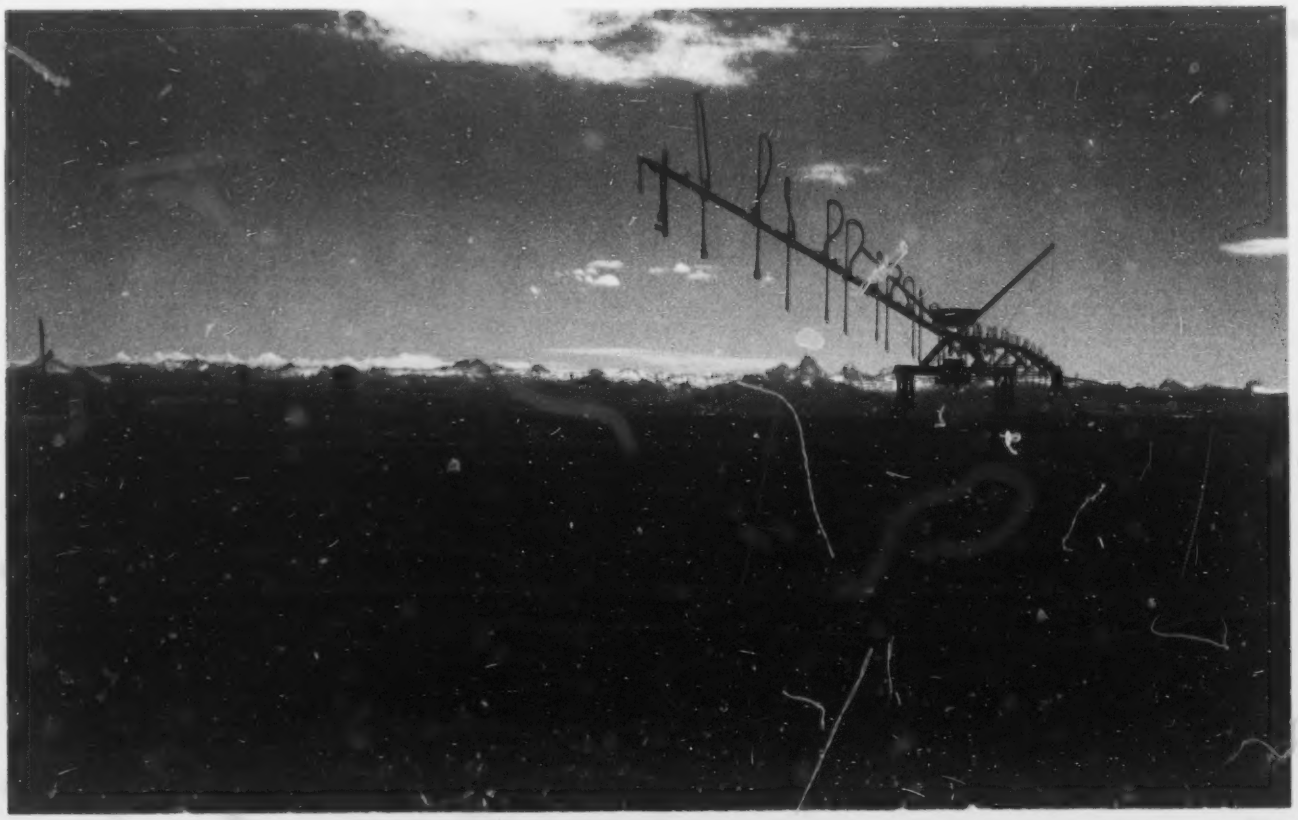
[2] Includes crops produced in Idaho for which USDA does not estimate individual values of production.

[3] The livestock commodities include only Idaho estimates of income for which USDA estimates value of marketing for 1982-84. All other estimates, while included in commodity group totals, are not listed separately but are combined as appropriate in "Other Livestock and Products" to prevent disclosure of confidential data.

[4] Cash receipts include value of home consumption.

[5] Included in miscellaneous crops.

[6] Includes mink and trout, not previously included in this category.



POTATOES: IDAHO'S TRADEMARK CROP

Potato acreage and production has steadily expanded in Idaho over the years as the State's quality has become famous nationwide and worldwide. From the beginning of World War I harvested acres went from 35,000 to 100,000 in the late 20's. Another rapid period of growth occurred during World War II when acreage climbed from about 130,000 to 205,000. In 1957 Idaho surpassed Maine as the top producer for the first time and has remained on top since. Potatoes continued on their upward climb in the 60's and 70's with the record harvested acreage being reached in 1978 at 365,000. The 1985 crop at 345,000 harvested acres, while not a record (the 4th largest) did set a record yield at 297 cwt. per acre and a record field run production level, 102.5 million cwt. Advances in technology have been most noticeable since 1906 when yields first got above the 80 cwt. per acre mark. By the 20's yields were in the 110 to 120 range. By the late 30's and 40's, with increased mechanization, yields reached the 135 to 180 range. Now, statewide yields below 250 would be considered low with 270 to 280 a standard level.

Eastern Idaho, as always, retains over one-half of the State's potato acreage with Bingham County the unchallenged leader in acreage and production. Other top producers are, in 1984 crop year order, Cassia, Bonneville, Madison, and Fremont.

National interest in Idaho potatoes is tied to overall production, quality, and transportation costs. As potatoes are a crop with a very inelastic demand (consumption responds little to changes in prices or prices respond significantly to small changes in supply) farmers in Idaho must produce for the market share they have and with top quality in mind. Evidence that Midwest producers have a major transportation cost advantage means Idaho must continue to export a top quality product to successfully compete. Another plus for Idaho potatoes: they fit well into crop rotations with small grains and hay.

Nearly all of Idaho's potatoes are the Russet Burbank variety. In 1985, only about 3 percent were Norgold Russets, Lemhi Russets, whites, or reds. The Russet Burbank is both an excellent baking and frying variety and helps account for Idaho's deep penetration into the national market (29.3% of the 1985 fall crop in the U.S. was produced in Idaho).

2/1985 Preliminary

1985: A CROP YEAR HIT BY DROUGHT

Early soil moisture in 1985 was only fair at best due to a dry, cold January and below normal spring precipitation over the southern part of the State. Spring came early with the first three weeks of April, but then reverted to a sharply fluctuating temperature pattern with a series of disturbances in May. However, by the end of May plantings and crop progress were still on a normal schedule.

Farmers' hopes for a good crop year were dimmed by drought which began in earnest after the first week of June. Non-irrigated pasture conditions and hay yields suffered. Irrigation water was adequate. Grasshoppers and excessive heat in July caused additional damage and placed stress on crops, particularly potatoes. Some irrigators could not keep up with water needs. August was unusually cool and September and October were unusually cold. Severe frost damage was inflicted on potatoes in late September and early October, interrupting what otherwise would have been terrific yields of top quality.

The crop production index for 1985 was 119 (1977 = 100), 4 percentage points below 1984's level and 1 percentage point below 1983's PIK reduced level. Drought reduced small grains, hay and dry beans accounted for nearly all of the decrease. The potato index increased significantly from 98 in 1984 to 116 in 1985. Large decreases in wheat, barley and oats pulled the small grains index down from 152 to 130. The fruit index increased from 140 to 143, as a result of increased apple and peach production. The all other field crops index fell 7 points from 118 in 1984 to 111 in 1985. Other crops include corn for grain, mint, dry beans, sugarbeets, vegetables and hay crops.

CROP PRODUCTION INDICES (1977 = 100): Idaho, 1976-85

SHEEP PRODUCERS FARE BETTER THAN OTHER LIVESTOCK PRODUCERS IN 1985

Idaho's livestock and dairy industries were plagued by depressed prices, continued predator problems, and surplus production during 1985. Average cattle prices for the year were the lowest since 1978, and a nation-wide surplus of milk suppressed dairy prices. The one bright spot for the year was Idaho's sheep industry, where producers did receive higher returns from a year earlier.

Fed cattle marketings totaled 472,000 during 1985, the same level as in 1984. Ninety-seven percent of the marketings came from feedlots with over 1,000 head capacities. Commercial livestock slaughter in the State included 817,200 cattle, 98,200 hogs, and 6,600 sheep and lambs. Sizeable numbers of Idaho-produced hogs and an even larger portion of sheep and lambs were shipped out of state for slaughter. End of year inventory counts showed 1.75 million head of cattle and calves, 125,000 hogs, and 320,000 sheep and lambs.

A special survey of Idaho sheep ranchers on losses from predators showed coyotes to be responsible for 28.7 percent of the deaths of all sheep and lambs in 1985. The value of the 70,000 head lost from all causes totaled $4.87 million for the year.

Dairy production during 1985 increased 11 percent to 2,421 million pounds. Over 1.1 billion pounds of milk were utilized by the State's dairy plants in the manufacture of cheese. Total cheese production was 140.4 million pounds, and of this, 110.0 million pounds were American Type Cheese (primarily Cheddar and Monterey Jack). Idaho's American Cheese production was exceeded only by Wisconsin and Minnesota.

Other Milk Products[2]	322,513	347,500	321,759	345,151	4,114
TOTAL	1,671,517	1,787,868	1,889,638	1,715,939	1,927,916
Duplications	111,322	121,220	124,697	123,411	126,410
NET TOTAL[3]	1,560,195	1,666,648	1,764,941	1,592,528	1,801,506

[1] Products manufactured do not necessarily show utilization of milk produced in Idaho because of interstate shipments of milk. No adjustment has been made for shipments of milk and cream between States different in the test of milk produced.
[2] Milk equivalent of other dairy products including items produced by less than three plants.
[3] Net total accounts for fat recovered from whey cream and used for making butter, and the amount of fat from butter and condensed milk used in making ice cream.

IDAHO SHEEP PRODUCERS SUFFERED A $4.87 MILLION DEATH AND THEFT LOSS IN 1985

Idaho sheep producers lost an estimated 70,000 sheep and lambs, valued at $4.87 million, in 1985 from all causes. This is the same number of losses reported in 1984 but value of losses, at $3.98 million, were lower due to the depressed sheep market. Increases in losses were reported in lambing complications and old age while fewer death losses were attributed to weather conditions during 1985. Predator losses, at 34.9 percent, continues to represent the largest share of losses and is the largest percentage attributable to predators since 1981. Coyotes, at 20,100 head of sheep and lambs, continue to be the number one cause of death in both lambs and mature sheep accounting for 28.7 percent of total losses. After coyote losses, weather conditions, at 17.0 percent of total losses or 11,900 head, caused the most losses followed by disease problems, at 14.5 percent, or 10,200 head. Lambing complications claimed 6,800 ewes and lambs; 3,400 sheep died of old age; 1,800 head were lost to poisoning; bears killed 1,600 head and domestic dogs accounted for a loss of 1,300 head. Other causes such as fire, starvation, accidents and dehydration caused an additional 3,700 sheep and lamb deaths during 1985.

IDAHO AGRICULTURAL STATISTICS, 1986
Estimates Issued by Idaho Agricultural Statistics Service

Current estimates of the data published in this bulletin are available from the Idaho Agricultural Statistics Service at various times throughout the year. The table below indicates the months data are available. Current data may be obtained by calling the Agricultural Statistics Service or interested persons may be added to one or more of our three mailing lists. The three separate mailing lists are: (1) All potato reports, (2) Weekly Crop Weather report, and (3) "Agriculture in Idaho," a semi-monthly publication containing various crop, livestock, price and other farm data. The annual charge for these publications is: Potato reports, $10; Weekly Crop Weather, $12; and "Agriculture in Idaho," $10. Reporters on our surveys are not charged. An order form may be obtained by calling or writing the Idaho Agricultural Statistics Service.

Richard Max - page 45

The Idaho Department of Agriculture and the Agricultural Statistics Service find it necessary to reduce the cost of publishing and mailing reports. This is accomplished by reducing the number of publications, reducing our free mailings, and placing current mailings on a fee basis. These changes were effective July 1, 1982. The cost of this publication is $5.00.
